

NaturalFlex™ II - Smile with confidence!

Eliminates Unsightly Metal Clasps

Since their invention in the early 1930's, partial dentures have been held in place by thin metal clasps (or "hooks") placed around your remaining teeth. Unfortunately, no matter how well designed, these silver-coloured facial clasps often drew attention to the partial. And, over time, they could damage your remaining teeth through abrasion.

Now, with NaturalFlex II, your dentist can create a partial using natural-looking, tooth or tissue-coloured clasps completely eliminating visible metal display. Almost impossible to see in the mouth, a NaturalFlex II partial is a joy to wear — super strong and tough for long life yet lightweight and flexible for a truly comfortable fit. Kind to your remaining teeth, no other partial is as easy to insert or remove.

Truly Natural Appearance

NaturalFlex II's wide range of shades ensures that you receive a partial customized to closely match your remaining teeth. With NaturalFlex II, you can smile, talk and chew with greater confidence.

Non-Metal Versions Available

For those who would prefer to completely eliminate metal, a full vinyl resin version of the NaturalFlex II is available. With these truly biocompatible partials, allergic reactions are virtually eliminated.

Ask Your Dentist

NaturalFlex II can improve the look and feel of your partial dentures. Why not ask your dentist for more details on how NaturalFlex II can benefit you.

A Difference You Can Clearly See.

Just compare the white clasp shown on the right of this metal framework with the highly visible metal clasp on the left.
