

Immediate Dentures

Easing the Transition from Natural Dentition to Permanent Dentures!

Extraction, as a final step to full dentures, often means three-six months of healing before impressions can be taken; dentures tried in and adjusted;

and the final definitive denture crafted. Now, with Immediate Dentures from Aurum Ceramic/Classic, patients can "keep their teeth" while their gums are healing.

Fast, Simple Procedure

- Single or double arch treatment.
- Requires no healing period between extractions and placement of dentures.
- Fabricated prior to removal of remaining teeth and delivered immediately after extraction.
- Usually requires only one surgical appointment.
- Can even be created as partials to replace certain teeth.

Assists in Resolving Clinical Challenges

- Serves as splint to reduce pain and swelling after oral surgery.
- Allows natural tooth position to be duplicated or altered as required.
- Permits test period for changes in tooth position before definitive dentures are made.
- Gums tend to heal to the shape of the dentures.

Immediate Positive Patient Reaction

- Cheek and lip support maintained (instant effect on appearance).
- Patient able to chew food and maintain proper nutrition during healing.
- Performs as spare/emergency denture after definitive dentures delivered.
